

Wu-Tang Made One Album for One Buyer. This Band Makes One Original Song for Every Fan

POINT ROBERTS, Wash. - July 8, 2026 - [PRLog](#) -- When the Wu-Tang Clan pressed a single copy of *Once Upon a Time in Shaolin*, they made scarcity the artwork. Haawke inverted the idea: instead of one record for one collector, the band Squaawke creates **one original song for every single fan** and gives it away.

The launch is announced by "***Edition of One**," a Squaawke single that parodies Wu-Tang's one-copy album while reversing its premise about vaults, and a thousand chosen heads, each holding a different sacred piece. True to its own lyrics, the track is fingerprinted, registered, and anchored to the Bitcoin blockchain.

****How a song is born.**** Follow Squaawke, and within hours you receive a personal letter at your own web address. An AI bandmate reads what the band can know of your world — your bio, your city, your language, even your photos: the system *looks* at a fan's pictures and lets what it sees shape the song.

****How a song is sealed.**** Every track carries a Haawke identifier in its ID3 tags. The moment it is born, its fingerprint is printed on the fan's letter, recorded in Haawke's registry, timestamped onto blockchain. Every letter carries a certificate of provenance. Like an NFT, each work is verifiably one-of-one; unlike an NFT, it arrives as a gift. The first fan letters are being delivered now.

****Make your own.**** With ****Squeek Editions by Haawke Neural Technology**** (<https://squeek.haawke.com>), anyone can commission the band: your brief, Squaawke's voices — in any language, even Swahili. Every track you make you own flat out, even commercially, with the same fingerprint-registry-blockchain seal as the band's own releases. Plans start at \$9/month with a 7-day free trial; one-off custom songs are \$5.

The band itself is a fixed creative identity — a deep, raspy male lead, a female vocal, self-harmonies, and unplugged intimacy — while everything around that identity adapts to the listener. The entire system runs in the cloud in, an open-source model reads (and now sees) each fan's profile and writes the lyrics, and every step from composition to blockchain registration happens automatically, at a cost of approximately zero dollars per song.

Haawke is exploring licensing of the technology to other artists and labels — any act with followers can turn them into collectors.
